

"HyperMotion Technology" was created to help players create more realistic ball control, create more feel and emotion, and improve player movement during dynamic moments by analysing what's happening in real time. FIFA 20 introduced Kicking and Free Kicks, animations that were given to players in real life. The new system automates and speeds up the processes. Kick to Shot Kicking is a necessary ingredient in every team's attack. Without it, your players will lose the game. Realistically, all players can kick at any time during the match with the natural kick animation reacting as the player strikes the ball, including the ball going in the net. Kicking animations are also very important to the full control of the game. In FIFA 20 there were two types of Kicking - One for a long kick and one for a short kick. FIFA 22 updates all kicks to the current image-based system. There is a new animation where a player holds the ball and then kicks it in a certain direction. Shots that are directly driven into a defender, with the goalkeeper blocking, or a corner kick from an out-of-bounds position will have a strong, more devastating kick. The size of the ball, speed, direction of the kick and if it goes in the net can be modified. These features of the new simulations will make aiming at the opponent more realistic. There are also visual improvements with exaggerated motion and style for heading the ball. There is also the new ability to use 2 fingers to control the air passing the ball and even catch a forward pass. Precision and simulation of shot impact and rebound have also been improved with more impact feedback in game. Realistic ball behaviour like tackiness, rebound angle and creation of new trajectories have also been improved in the new system. Scorpion kick creation has also been improved with more accurate directional and trajectory simulation. Scorpion kicks can now be launched from any angle. Pitch-based shots by doing a 360 panorama full body motion have also been introduced to give more realistic feeling to the player. It is also possible to hover with the ball on the floor, like dribbling. 'Ball Impact Detection' gives players more control over the ball before and after they are struck by the opponent. Ball Impact Detection pushes back the ball if you don't touch

#### **HyperReal Football features**

Easier, faster, deeper - the Revolution of the Game meant the passing style was introduced, it was more important to create "passing lanes" that let you pass the ball to a teammate using standard "football rules," rather than the kick-and-rush pass. The double touch, added at the start of the decade, let you quickly make a decision on the same field, without going through the typical process of calculating a passing lane.

FIFA makes classic sports more realistic, and EA Sports has incorporated these changes to bring the most realistic experience to FIFA gameplay.

Content on this page comes directly from press releases and fact sheets provided by publishers and developers and was not written by the Game Revolution staff. In the last century, the consistent application of quantitative genetics to major crop species has contributed to the development of many public initiatives. Here, we present a series of articles that were written over the years to coincide with the 30th anniversary of the first quantitative trait locus (QTL) analysis on tomato. The concept of quantitative genetics that underpins the contributions of these articles was presented at the International Conference on Quantitative Genetics and Breeding (ICQGB) in Portugal in 1996 ([@CIT0001]). Numerous quantitative genetic studies have emerged over the past 30 years, helping to improve the understanding of the genetic architecture of quantitative traits in crop plants, including tomato. This has helped plant breeders to understand the genetic control of a wide range of agronomic traits of importance for crop improvement. These studies have focused on local adaptation, the key for building resilience of crops to environmental change, and the effect of domestication. They have also contributed to the understanding of quantitative traits in ornamental plants and important fruit crops. The first quantitative genetics study on tomato was performed by [@CIT0002], who used the F~2~ population generated by crossing \*Lycopersicon esculentum\* Mill. (Solanaceae) and the diploid species, \*Lycopersicon pimpinellifolium\* Zucc. (Solanaceae) to dissect the genetic determinism of flower color and fruit shape. These experiments followed an earlier study by [@CIT0003] that was conducted in an F~2~ interspecific backcross population generated from a cross between a cultivated tomato, \*L. esculentum\*, and the wild relative \*L. peruvianum\* L. (Solanaceae). The genetic analysis of these two populations clearly showed the presence of one dominant locus controlling the major qualitative trait, flower color, and a locus controlling the quantitative trait of fruit shape. Because of these advances, the tomato industry shifted from the use of hand pollinating flowers to commercial hybridization. In the 1990s, tomato quantitative genetics research shifted from the mapping of QTLs controlling seed yield, components, and bc9d6d6daa

FIFA is an annual series of official sports video games produced by EA Canada in conjunction with Eidos. Developed for several different platforms, starting with the original FIFA in the year of 1991 for the Sega Mega Drive and Commodore Amiga, the game is best known for the yearly release of its famous franchise FIFA, a football sport game. FIFA is an abbreviation for football, the name that is used for the sport in many countries. The FIFA name was also used by other earlier iterations of the game, but it was never used again. In its long history, FIFA has spawned six different main games series, each of which spanned multiple main game iterations (e.g. FIFA 97, FIFA 97 Gold, FIFA 98, FIFA 99, FIFA 10, FIFA 11) and multiple game platforms (e.g. Xbox 360, PS2, PSP, PC), representing various football sports. In most of the previous games released, there was no set season during which the game was played; rather, the game year was time-based and allowed for the inclusion of real-world events such as the FA Cup and UEFA Champions League. In 2005, the series was revived with the release of FIFA Football 06, the first game in the long series to be produced for the then current generation of consoles, the Xbox 360 and PlayStation 3. Starting with this game, the release year of the game was also adjusted to match that of the current season, in this case 2006. With the release of FIFA 07, the series returned to the long-established year-based gameplay and featured several other minor additions. The development studio creating FIFA, EA Canada, was initially founded as the sports division of the Electronic Arts subsidiary of Maxis, EA Canada continued to use the Maxis name with the next installment, FIFA 08; which was a reboot of the previous series instead of being a sequel. Starting with FIFA 09, the game was only released on the PlayStation 3 and Xbox 360 consoles and the development studio once again changed its name to EA Vancouver. Within the series, FIFA 10 continues to be the only main game that does not have a version for all of the previous consoles that were released. Starting with FIFA 11, the series moved to the unscripted online game format and integrated more gameplay customization options, as well as basic social networking features. The core gameplay has been kept largely the same throughout the series, only becoming more complex, in contrast to other sports-oriented video game series such as NBA 2K and NHL 2K.
