Photo editor for the social media age The social media age requires an image editor that can create attractive images for your Facebook and other social media feeds. It also needs to have quick access to the programs that generate the images you need in case you find yourself with content but no imaging program. The easiest way to create an image is to use the features of a large graphics program that focuses on creating images — like Adobe Photoshop and Adobe Photoshop Elements. It offers a collection of tools that create images using a basic layer-based system. You can add overlay with transparency to adjust images and create unique layouts. A photo editor like Photoshop or Adobe Photoshop Elements, however, is geared toward professional use. You can access and use these features but you have to be willing to pay for the software and licenses. Creating an image for social media is a much different process than creating a photo for a print publication or a web page. For one thing, you may not have access to a desktop photo editing program. You're also unlikely to have the time to be able to create an entire image in a matter of minutes. These days, you can find some really great free photo editors for creating images for social media. These editors enable you to create images using a variety of tools, such as filters, graphics, and images, all in a very rapid fashion. Here are a few of the more popular free photo editors that work well for social media

Efficacy of cefepime in the treatment of deep-seated urinary tract infection. Deep-seated urinary tract infection (UTI) is challenging to treat because of the poor tissue penetration and penetration-enhancing properties of many commonly used antimicrobial agents. We evaluated the efficacy of cefepime (Zinacef) in the treatment of deep-seated UTI in children. The study was performed in two phases: a 2-phase, open-label, non-comparative pilot study (phase I) and a 3-phase, open-label, comparative, multicentre trial (phase II). The goal of phase I was to determine the efficacy of cefepime in deep-seated UTI in children, defined as renal lesions extending to the bladder wall. The goal of phase II was to compare the efficacy and safety of cefepime with those of ceftriaxone (Rocephin), based on clinical and microbiological outcomes, including drug-related adverse events (AEs). The primary endpoint was clinical cure at test of cure. In phase II, the data from phase I were used to analyse drug-related AEs. A total of 106 patients received cefepime monotherapy in phase I and 56 patients received cefepime with or without prior therapy in phase II. All strains were identified to the species level by the reference method. In phase II, more (85.4 vs. 77.2%) patients were clinically cured in the cefepime-treated group than in the ceftriaxone-treated group at test of cure (P=0.03), and the differences were clinically significant. However, at test of cure, 67.7 vs. 77.8% of patients had an

eradication of micro-organisms in the cefepime- and ceftriaxone-treated groups, respectively. Incidences of drug-related AEs and serious drug-related AEs were similar between the two treatment groups. In children with deep-seated UTI, there were no differences in efficacy and safety between cefepime and ceftriaxone. These results suggest that cefepime could be a useful alternative treatment option for deep-seated UTI in children. UNPUBLISHED
