In recent years, three dimensional printing (3DP) has seen rapid growth as a new type of printing technology. 3DP has been applied to manufacturing a wide variety of products from food to tools, and in the medical field, 3DP has been used to create prototypes and models for healthcare related products, including surgical models, stents, pacemakers, and the like. 3DP is also known as layer-by-layer printing, photopolymer printing, selective or selective direct polymerization, and the like. The various ways of 3DP have their own advantages and disadvantages, and most of the materials currently used in 3DP are in liquid form. In 3DP, a nozzle is typically used to deposit liquid materials onto a 3D surface. The drop diameter is generally in the range of 5-200 μm , and the drop spacing is on the order of 10-1000 μm . The material printed onto a surface is in liquid form, and for most applications, remains in liquid form until it is cured. In the context of 3DP, liquid material refers to one or more of any of the following: the photoinitiator used in a photopolymer printing process; the solvent or the precursor of the material printed; the material or the material precursor deposited in the printing process; and the material or the material precursor used to form the product, e.g., in a selective-lithography process. In many cases, it is desirable to cure the printed material with ultraviolet (UV) light. However, it is well-known
